

Debris Collection Write-Ups

TJ Palmer

01/17/23 Debris Collection Write-Up

The following data represents a categorized count of all but two very large trash items (wooden palette and rubber air mattress) caught in a 100 ft x 2 ft section of metal fence (2"x2" openings) on Fashion Valley Rd on Tuesday January 17th at 3pm following a moderate flood event on the 16th of January. I recorded video and captured photos of the site and then proceeded to collect all visible trash items that I could pick up in a standard trash bag using latex gloves for protection. The trash/debris in question was caught in metal fencing constructed over a culvert above the road. There was a substantial amount of organic debris such as twigs, branches, and especially long grasses caught in the fencing. Amongst all this organic debris was also a noticeable amount of trash, especially plastic wrappers and plastic bags. Much of these plastics were debris fragments. There was also a substantial amount of foam pieces and some articles of clothing (e.g three shoes were recovered). In the surrounding area there was a lot of similar organic debris amongst infrastructure (pipes, signs, etc) and natural vegetation (trees & bushes) interspersed with human debris of similar sizes and materials.

Stream Samples Feb 25 & Mar 1, 2023

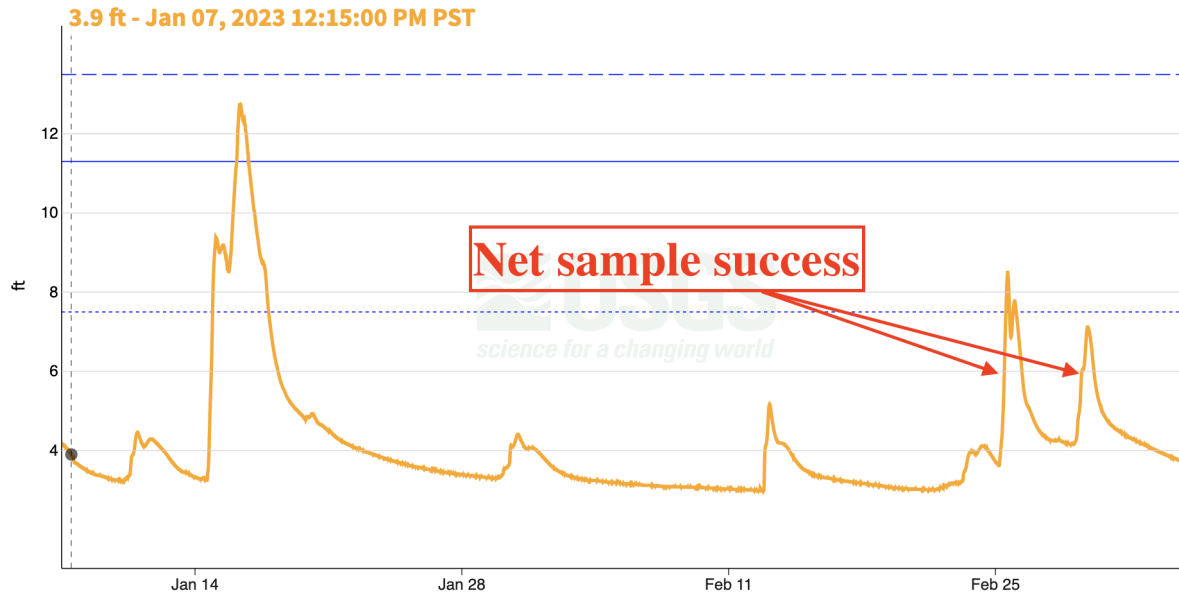

The following data represents two categorized counts of minor-moderate rain events on Feb 25 and March 1st, respectively. Both events were sampled on the "rising limb of the hydrograph between 5-7ft with similar measured stream flows. The 25th was a bigger event with more visible trash mobilization and more trash collected despite samples being taken at about the same point on the rising limb. Two possible explanations are one, the first event had higher measured stream velocities potentially leading to more trash mobilization, and second, there was

much more antecedent dry days (no substantial rain events) before the first event. More antecedent dry days allow for more trash accumulation in areas subject to inundation from rising water. In both cases the majority of pieces of trash were plastic, with the majority of plastic being polystyrene foams. Almost all the plastic debris were fragments. Another common item on the 25th were cigarettes. The mass of the sample from the 25th was majority wood from one heavy wood piece but still significant plastic debris mass. In comparison there was 17x less plastic debris by mass on March 1st, and much less visible trash mobilization.

Stream sample March 17th, 2023

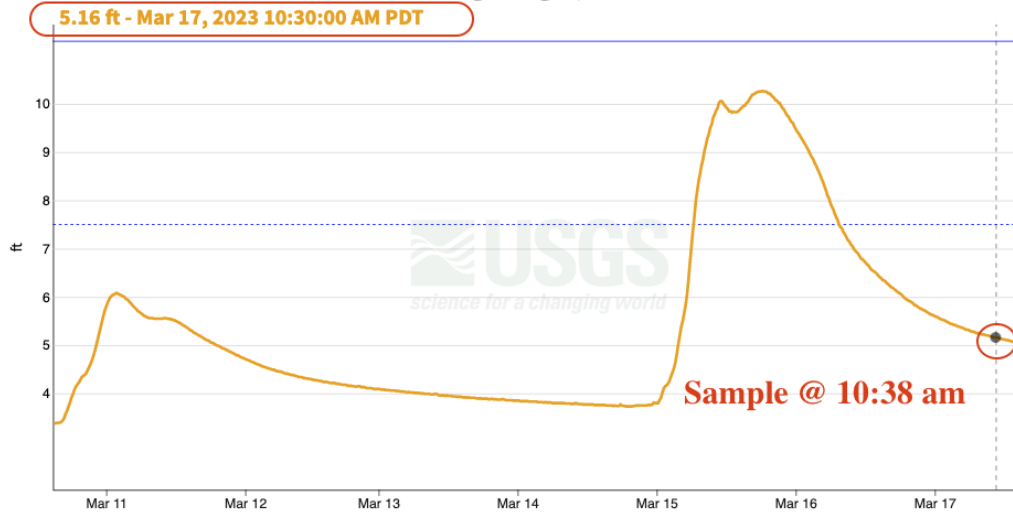

3/17: This event included one in-stream sample and an opportunistic fence trap collection following a minor flood event (gage @ 10.27ft @ 6:15pm 3/16). Very little mobilized debris were seen and **ZERO** debris was captured in the net (15 min @ 3.49 ft/s), though one plastic bottle was observed prior to sampling.

Trash Count 3/17 @ 10:30am: Sample 1/1 Time = 15 mins - Velocity = 3.49 ft/s	ZERO debris in falling limb
